

Consulting Services

Oil companies face continual pressure to reduce costs—in E&P this means reducing cycle-times and making better informed decisions. To achieve this improved efficiency, geoscientists need to use optimal workflow processes and have ready access to all the relevant information.

However, new technology creates ever more sophisticated and powerful tools, increasing the choice and complexity of processes available to the geoscientist. This has also led to a relentless growth in data volumes. Geoscience workflow and dataflow practices have never had a greater impact on business performance in this challenging environment than is the case today.

Improve your workflows and their associated dataflows and you will improve the quality of your decisions, as well as the time taken to reach them—real, measurable benefits to your organization.

- 
- Consultants with extensive domain-specific experience
 - Vendor neutral and business-focused
 - Use our knowledge of industry best-practice to benefit your organization's unique requirements

Ensure that the information used to make your decisions is the best quality available by implementing comprehensive and clearly defined data management policies. Retain these benefits by developing a comprehensive knowledge management strategy.

The GTS Geotech consulting group delivers a range of high-level consulting services to the upstream oil and gas industry, from workflow analysis to geotechnical systems audits. Consider us your IT coach. We have a wide range of hands-on experience within the industry with special focus on:

- E & P workflow analysis
- Data management strategies
- Electronic document management
- Knowledge management implementation
- Geotechnical system audits

GTS Geotech is the largest independent supplier of applications and systems support to the oil and gas industry.
